

Transactions must pass from the cart to DRM either by Webservice. Here is the minimum information that this transfer must include:

cartTransId

customerId

passThroughAmt (the sale value of the line item)

productId

productName

productQty

returnValue (this is not a value the cart inserts but one that it receives after a successful insert)

drmId (the DRM retailerID associated with the line item)

salespersonId (this is for sometimes used retailer salespersonID; if no floor sales then set this to "0")

transType (1=B2C, 2=B2B, 3=Tax&Freight held by retailer, 4=Tax&Freight to manufacturer)

Note: tax should have a productId = 100000 and freight's productId should be 1000001.

More fields may be required based on reporting requirements and business rules.
